Davis,

Please find an updated filter sieve sheet attached to be utilized there was a few minor errors in my last sheet that did not plot things properly.

As we are having a lot of issues with conducting these sieve tests, **we would like to see the results as soon as the tests are completed.** To data F13-11 is completely out of spec, however it is also the sample that is within spec for testing procedure... thus this creates a bit of an issue.

Also I noted that F13-10 states that the filter material is contaminated with snow? The filter material needs to be "clean" contamination free... and absolutely no snow should be placed on the dam.

Hi Dmitri,

Like I said, I was having the same issue with losing a large portion of the sample in the Gilson. I think I have figured out how to resolve it and will try it out when I get a chance to process the sample I collected today.

Davis
